Sampling steps and target-frame metrics

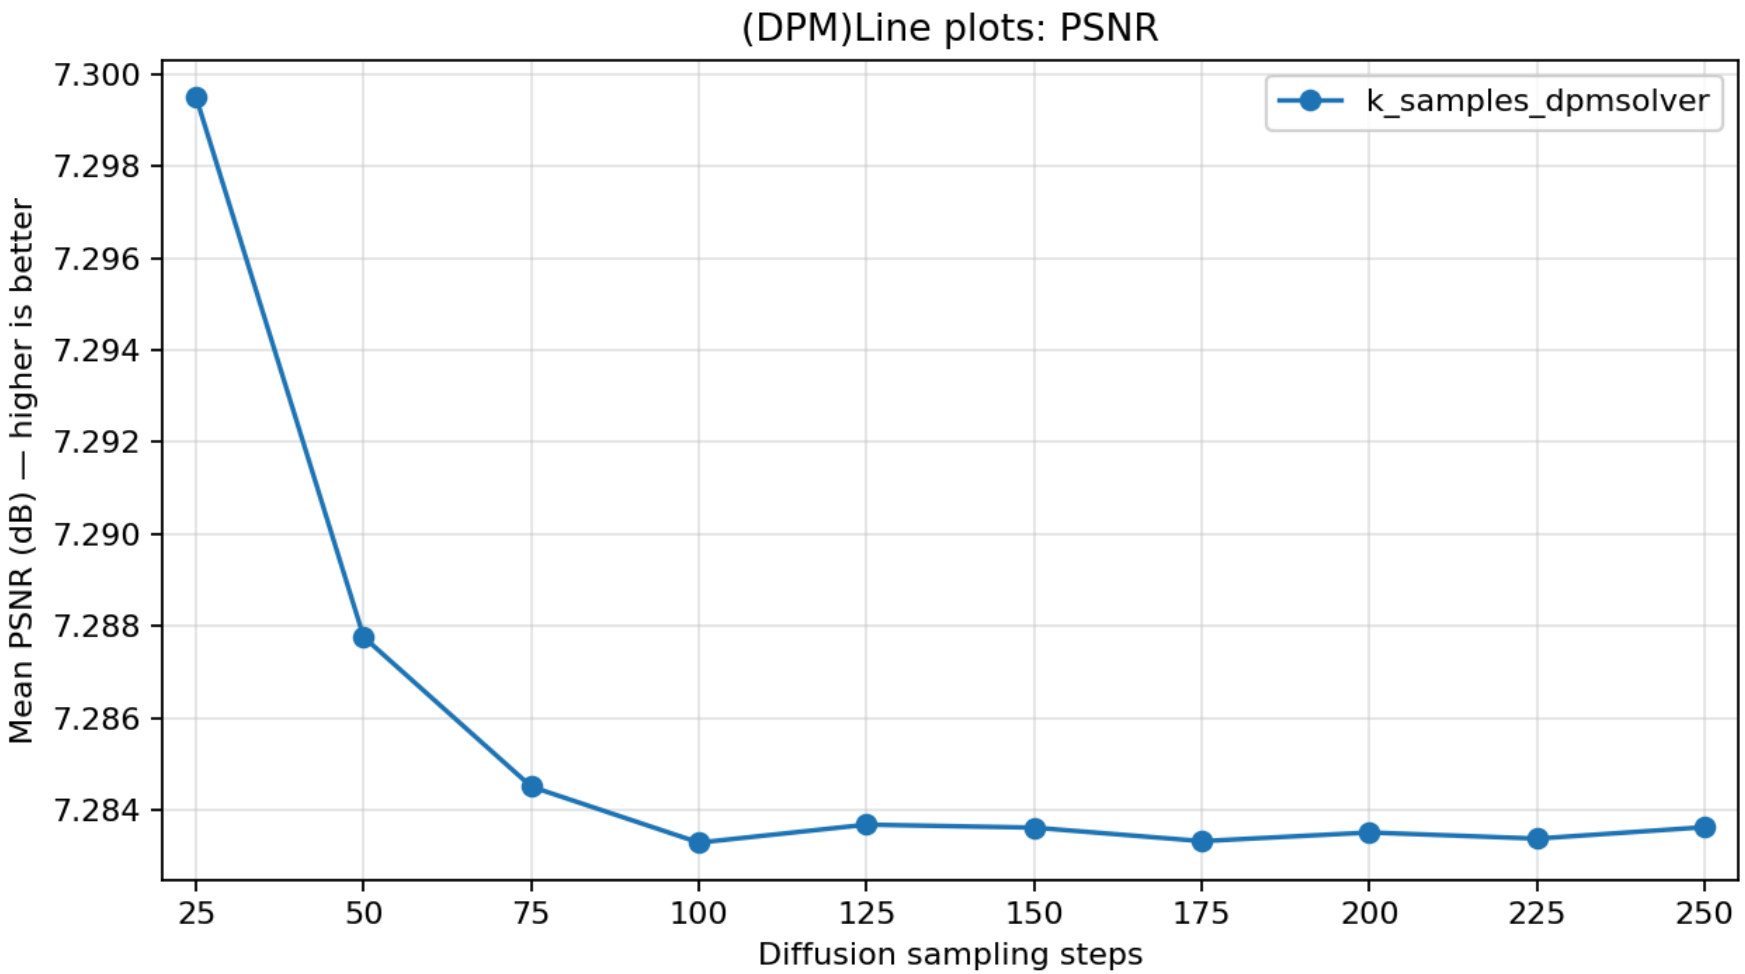

Steps are set manually in config.py. Missing steps are not interpolated.

Curves use the same valid target frames across currently available steps, separately for each metric. Means can change when another step introduces a failed or invalid target. Reference frames are excluded. All-valid means and coverage are also shown. No invalid score is replaced by zero.

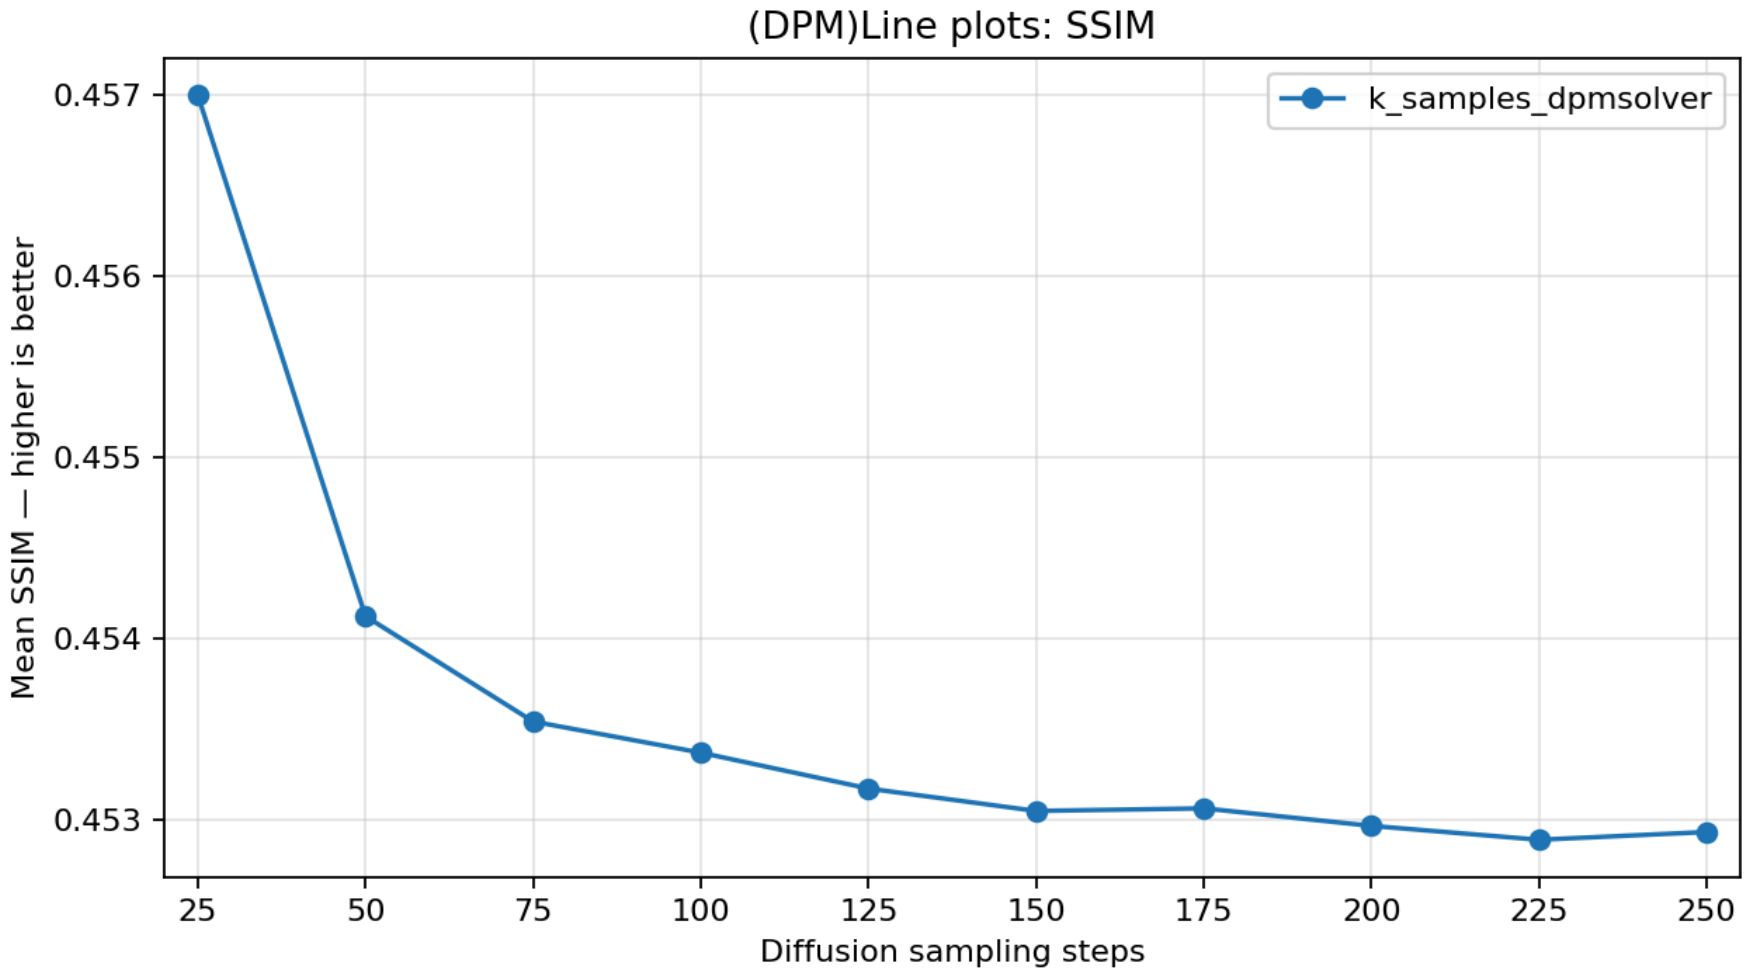

Each target has equal weight; its score is the existing average over present hands. These image metrics do not measure hand orientation accuracy directly.
